

GridAI

Anti-Herding Compliance for Distributed
Energy Resources

Four agents on Band · Regulated & High-Stakes
Workflows

lablab.ai Band of Agents Hackathon · June 2026

THE PROBLEM

Australia has 15 GWh of home batteries reading the same price signal.

When they all respond at once, they synchronise.

The fleet creates a new evening demand spike instead of smoothing the old one.

471 voltage breaches at the network edge.

This is the herding problem — and it gets worse as VPPs scale.

Current DERMS/VPP platforms (EnergyHub, Kraken, AutoGrid) coordinate DERs — none expose anti-herding assurance.

WHY IT'S HARD

The problem is second-order: it appears precisely when VPP coordination succeeds.

Each aggregator's fleet looks fine in isolation. The failure is at the system level.

WHAT EXISTS	WHAT'S MISSING
DERMS platforms coordinate DERs well	Anti-herding assurance before dispatch
Voltage constraint management is table stakes	Cause-attributed breach compliance
Real-time dispatch of storage fleets	Regulator-ready audit trails

Commercial DERMS expose coordination. None expose anti-herding compliance as a primary artifact.

THE MECHANISM INSIGHT

Desynchronisation is not just a protocol problem.

It depends on fleet-level value heterogeneity. The market design matters as much as the protocol.

Heterogeneous fleet synchrony is ~55% lower than homogeneous. Market incentives shape the outcome.

THE SOLUTION

GridAI: gossip-based decentralised protocol with a Band-native compliance layer.

- Each battery negotiates with local neighbours only using SOC and owner preference.
- No central controller. Converges in 1 round.

Battery-herding overvoltage:

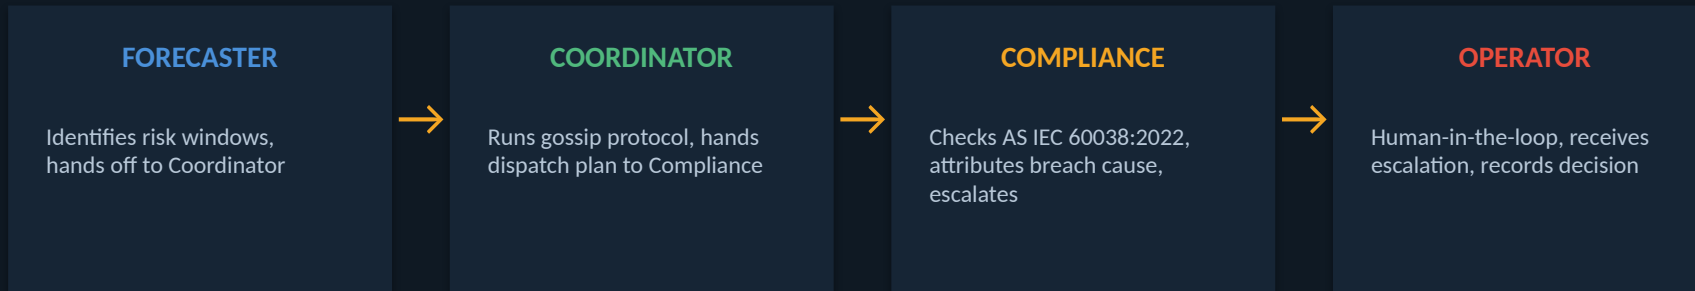

471 → 0

Honest tradeoff: mild far-feeder undervoltage (distinct from herding, surfaced not hidden)

THE BAND ARCHITECTURE

Four agents coordinating through Band as the actual collaboration layer.

BAND: shared room · @mention routing · append-only audit log · identity & handoff

Every handoff is traceable. Removing any agent breaks the chain (verified).

Band agents: @s4142972/gridai-forecaster · coordinator · compliance · operator

THE EVIDENCE

Metric	Naive	GridAI
Battery-herding overvoltage	471 steps	0 (eliminated)
Synchrony	1.000	0.167
Max simultaneous discharge	60/60	10/60
Convergence	—	1 round
Peak demand reduction	—	−0.9% (honest)

89 tests passing • including provenance coherence & agent interdependence

AEMO 2012 Victorian data, 17,568 rows. Representative day: 2012-01-24 (highest evening peak, 8,864 MW).

THE COMPLIANCE ARTIFACT

Naive price-following synchronised the fleet and breached the voltage band. Human operator decision required.	BAND AUDIT TRAIL – GOSSIP [1] 2026-06-12 05:06:55 forecaster - BAND register register capabilities: ['planning', 'demand_forecast', 'risk_identification'] [2] 2026-06-12 05:06:55 coordinator - BAND register register capabilities: ['execution', 'gossip_coordination', 'dispatch_planning'] [3] 2026-06-12 05:06:55 compliance - BAND register register capabilities: ['review', 'voltage_compliance', 'audit_trail', 'escalation'] [4] 2026-06-12 05:06:55 operator - BAND register register capabilities: ['decision', 'governance', 'human_in_the_loop'] ✓ APPROVED BAND audit · step 7 · 2026-06-12 05:06:56 compliance → operator · compliance_approval decision=APPROVED herding_overvolt=0 reason=Zero battery-herding overvoltage breaches detected under the gossip dispatch str Zero battery-herding overvoltage breaches detected under the gossip dispatch strategy. Gossip coordination successfully desynchronised the fleet and kept every node within the voltage band. Dispatch plan approved.
--	---

The Band audit trail is the regulated-workflows deliverable.

Every compliance decision is traceable to:

- The agent that made it
- The data it saw
- The moment it happened
- The cause category (pv_export vs battery_herding)

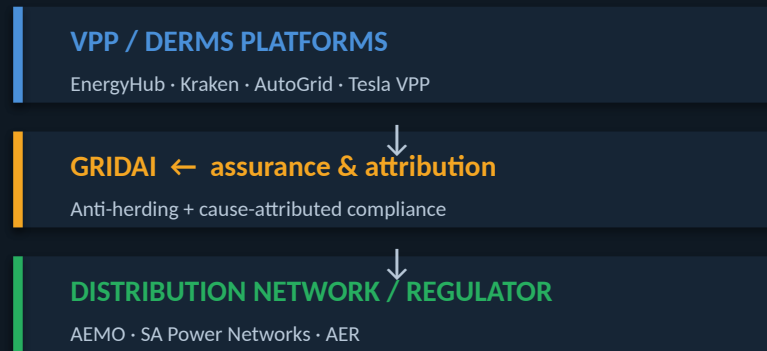

This is what a network operator or regulator can actually use.

AS IEC 60038:2022 · CSIP-AUS compliant · 8-step Band audit trail per scenario

WEDGE POSITIONING

GridAI is not a replacement for DERMS or VPP platforms.

It is an assurance and attribution layer that sits between fleets and the network.

NEXT STEPS

- OpenDSS validation
- Multi-aggregator scenarios
- CSIP-AUS live interface
- **RAISE Summit Paris, July 2026**
